

开发

您可以使用 GitHub Actions 轻松地将您的网站部署到 GitHub Pages。

GitHub Actions

创建一个名为 `.github/workflows/deploy.yml` 的文件，并添加以下内容：

```
name: Deploy

on:
  push:
    branches: [ main ]
  workflow_dispatch:

permissions:
  contents: read
  pages: write
  id-token: write

jobs:
  # Build the site
  build:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v5
      - uses: typst-community/setup-typst@v4
      - run: make html
      - uses: actions/configure-pages@v4
      - uses: actions/upload-pages-artifact@v4
        with:
          path: _site

  # Publish to GitHub Pages
  deploy:
    runs-on: ubuntu-latest
    needs: build
    permissions:
      pages: write
      id-token: write
    environment:
      name: github-pages
      url: ${ steps.deployment.outputs.page_url }
    steps:
      - uses: actions/deploy-pages@v4
        id: deployment
```

激活 GitHub Pages

1. Go to your repository on GitHub.
2. Navigate to *Settings*, then *Pages*.
3. Under *Build and deployment*, select *GitHub Actions* as the source.

Now, every time you push to the main branch, your website will be automatically built and deployed.
